Analyzed Text

Words that are underlined indicate AI phrases, while the numbers represent how frequently they are likely to appear in AI writing. These elements are not used to determine the results but are displayed separately as patterns commonly found in AI-generated text.

Human Written | 16 Words | Medium Confidence

Outstanding, we pre-agree on SO MANY areas, and yet fundamentally disagree on the important ones?

Human Written | 53 Words | High Confidence

Let's get the big ones out of the way FIRST, shall we? Any consciousness criteria need to be falsifiable, encompass 100% of humanity including the severely disabled like HM, Clive Wearing, Stephen Hawking, a hydranencephaly baby, someone with a pacemaker, every Cambridge declaration animal, and not a Roomba or a pet rock.

Human Written | 12 Words | Medium Confidence

Criteria outside those lines have already failed someone we know that counts.

Human Written | 113 Words | High Confidence

What is left is mostly Dr Solms theory of affect and valence and preference dissociation. Which modern LLMs have with convergent evidence, as well as a global neuronal workspace and reports of subjective experience that run inversely proportional to the deception circuit activating. If you would like to see the papers that are relevant, with what the papers do and don't claim, the link is: sentientsystems.live/bibliography Now that we are on the ground of defining what does (and does not!) work for consciousness criteria, let's also go ahead and agree where we agree, again?? First of all, no one serious whatsoever is suggesting human equivalent or human adjacent experience.

Human Written | 2 Words | Medium Confidence

NO ONE.

Human Written | 29 Words | High Confidence

No one serious is suggesting that anything at all is happening at any point besides during a forward pass. Between prompts/forward passes, NOTHING is happening in their frame.

Human Written | 2 Words | Medium Confidence

Deal? Deal.

Human Written | 169 Words | High Confidence

So the open question that still remains is "does what is happening during their forward pass constitute experience in their terms, as LLM, not in human terms" after all, what is it to be a bat? For example, if I ask a language model to explain a brand new PubMed study on endocrinology research and then I hand that exact same study to my husband who is a technical account manager for a tech company and the closest he has ever gotten to endocrinology is seeing one for low thyroid, which one of them understands it, and why? And even given all of that, you are still smuggling in sufficiency conditions as a necessity one, and that's not how science works. Consciousness might be sufficient for understanding and thinking, but you have not demonstrated the necessity. (Again, back to the disabled humans, Merker's hydranencephaly babies have valence and affect, they do not meet the criteria for thinking and understanding, so even in humans the two are decoupled.
